

GUIDE 2 OF 2 · PHONE

The app in the crew's pocket.

Six things a painter does on a phone. Everything the office sees comes out of these screens.

FOR THE TRIAL

Danny — the test that matters is whether a painter with cold hands and a full brush will actually do it. Each page asks one question about that.

Four taps a day.

Clock on when you get there. Sign on to the safety sheet. Mark off what you painted before you leave. Clock off.

01 Clock on and pick today's job

02 Sign on to the SWMS

03 Mark off progress and take photos

04 Flag extra work as a variation

05 Request paint and materials

06 Quick quote for small work, from site

On the clock since 7:42am, with today's total running.

Today's job, with where it is up to. Tap to open it.

Your call, Danny: will the crew clock on in the app, or do you want it to happen automatically when they arrive on site?

Hours that are not on a job.

Travel, training, yard time, rained off. The clock still runs — it just goes to an indirect bucket instead of a job, so the hours are paid but not charged to a client.

ALWAYS AT THE BOTTOM OF MY JOBS

Real jobs first, then the five indirect buckets. They never disappear, so there is always something to clock on to.

HOW IT RUNS

- 1 Open Jobs — real jobs sit above the indirect buckets
- 2 Tap the bucket that matches, same as tapping a job

THE FIVE BUCKETS

- Travel**
IND-TRAVEL
Between sites, or to the yard
- Training**
IND-TRAINING
Courses, inductions, toolbox time
- Yard / workshop**
IND-YARD
Loading out, gear, cleaning up
- Inclement weather**
IND-WEATHER
Rained off, too windy to spray
- Other**
IND-OTHER
Anything that fits nowhere else

Your call, Danny: are these the right five, and should travel between two jobs in one day be charged to a job instead of sitting here?

Everything for this job, one tap away.

Open the job and there are five things: progress, photos, variations, the safety sheet, and materials.
Nothing else to learn.

The job screen. The badges tell you what is already on file — 13 photos, 1 draft variation, 1 materials request.

WHAT EACH ONE DOES

Progress	Slide each area to what is actually done
Photos	Before, during, after — tagged to the room
Variations	Extra work found on site, with photos
SWMS	Tick the controls, sign on
Materials	Paint and gear needed, charged to this job

Your call: is that the right five, and which one should be the first thing they see?

No sign-on, no start.

The safety sheet you wrote at HQ shows up here. The painter ticks the controls that are actually in place, then signs. It is logged against the job with the time.

HAZARDS ON THIS SITE – TICK CONTROLS IN PLACE

☒ **Working at height**
Scaffold tagged; harness on roof

☒ **Ladders & access**
Ladder inspected, footed & tied

 Sign on to this SWMS

Hazards for this site with the control beside each one, then one green button.

WHAT THE OFFICE GETS

A line in the sign-on log: name, job, time. That is the record that the crew read the sheet before they started.

If a control is not in place, they leave it unticked — and it should be a conversation, not a tick.

Your call: should the app block progress capture until the SWMS is signed, or just flag it to you?

This is the number you invoice from.

One card per area. Slide it to what is actually done, tick the surfaces finished, add a photo. Then Submit update.

The screenshot shows a dark-themed app interface for a 'Lounge' area. At the top, 'Lounge' is written in white, with 'INTERIOR' in smaller text below it. To the right, '80%' is displayed in white. Below this is a horizontal progress bar with a teal segment representing 80%. Under the bar are four buttons: '✓ Ceiling' (teal), '✓ Walls' (teal), 'Trim' (grey), and 'Doors' (grey). Below these buttons is a square photo placeholder. At the bottom is a rounded button with a camera icon, the text 'Add photo', and a teal circle with the number '3'.

Lounge at 80% — ceiling and walls done, trim and doors to go, three photos attached.

HOW IT BECOMES 53%

Each area carries its share of the contract value, so the job percentage is a value-weighted average — a big elevation moves it more than a cupboard.

Nobody re-estimates it at the office. What the crew slide is what the client is billed on.

Best done at the end of each day, on site, while it is in front of you.

Your call: are areas and surfaces the right way to break a job up, or would the crew rather tick off whole rooms?

Never start extra work on a nod.

Rot, water damage, a wall that needs a gib repair — photograph it, pick the rate, enter the quantity, submit. It is priced and waiting for you at HQ.

Area

Lounge

What's the extra work?

Gib repair to water-damaged wall before painting

Priced from rate

Exterior wash · moss & mould · \$3.5/m²

Quantity (hr)

−

6

+

EST. VALUE

\$450

+GST

Attach photos (2)

Submit variation claim

- WHAT HAPPENS NEXT
- 1 It lands on the HQ dashboard as *to price*
 - 2 You check the photos, then approve or decline
 - 3 Approved ones go on the next progress report with the photos
 - 4 The value is added to the contract sum

The rate comes from your library, so the crew never guess a price — \$450 here.

Your call: should the crew see the value at all, or just describe the work and photograph it?

Paint ordered, small jobs priced.

Two smaller things the app does from site — a materials request tied to the job, and a quote for work you can hold in your head.

Kitchen / Dining

Ordered

Product, colour, quantity, and which job it is for — so paint spend lands on the right job instead of a shoebox of receipts.

Walls · 2 coats · \$22/m²

62

m² × \$22

\$1,364

Ceiling · 2 coats · \$17/m²

48

m² × \$17

\$816

Interior prep · fill, sand, spot-prime

62

m² × \$6

\$372

Quick quote — pick a rate line, type the quantity, the line total prices itself. Good for a hallway, a fence, one elevation; anything with scaffold or staging goes back to the desk.

Your call: should a quick quote be sendable to the client on the spot, or always come back to you first?

Try it on a real day with a real painter. Anything that takes more than a few seconds on site will not get done — that is the feedback worth having.

- 01 Will the crew clock on in the app, or should it be automatic?
- 02 Are those the right five things on the job screen?
- 03 Should the SWMS block work until it is signed?
- 04 Areas and surfaces, or whole rooms?
- 05 Should painters see the variation value?
- 06 Can a quick quote go straight to the client?
